# Notes on the Data and Methods Used in *Numbers and Neighbors: A Detailed Description of Illinois' Uninsured and Numbers and Neighbors: Underlying Tables*

## What Is the Current Population Survey (CPS)?

The Current Population Survey (CPS) has been conducted for more than 50 years by the Bureau of the Census and the Bureau of Labor Statistics. Every month, a scientifically selected sample of more than 50,000 U.S. households is drawn in order to gather information about employment and other labor force characteristics of the U.S. population. The sample is representative of the civilian noninstitutional population and can be used to describe attributes of the nation as a whole or of individual states and other geographic areas.

As early as 1948, two questions about income that were not part of the core CPS were added during one month of the survey in order to enrich the data. Today, a whole array of additional questions are asked during March, including questions about household and family characteristics, geographic mobility, marital status, educational attainment, income and poverty status, work experience, and health insurance coverage. The Annual Demographic Survey, or the March Supplement, is used to generate the annual Population Profile of the United States and many other reports. In 1999, Congress allocated additional funds to the Census Bureau to increase the sample size of the March Supplement specifically so that more reliable estimates of the number and percent of low-income children without health insurance could be produced. Beginning in July 2001, the sample for the Annual Demographic Survey was increased to 72,000 households across the nation. In 2003, the name of the March Supplement survey was changed from Annual Demographic Survey to Annual Social and Economic Supplement (ASEC).

The data used in *Numbers and Neighbors: A Detailed Description of Illinois' Uninsured* and *Numbers and Neighbors: Underlying Tables*

are from the Illinois portion of the CPS March 2004 ASEC Supplement, available on the CPS Web site at: <http://www.bls.census.gov/cps/cpsmain.htm>.

## The Census and the Current Population Survey (CPS)

It is important to understand the difference between the Census that is taken every 10 years and the Current Population Survey. The Census is not based on a sample, but attempts to obtain a complete count of every person living in the United States. Because this is such a formidable task, the Census is carried out only once a decade, and it asks only the most essential questions about who we are and where we live. Surveys, such as the Current Population Survey (CPS), ask more detailed questions because they are asked of a much smaller number of people—a sample—and asked in a very timely manner—once a month.

Of course, we are really interested in knowing the characteristics of the whole nation or the whole state, not just those of the relatively small group of people included in the survey. Therefore, numbers from the Census are combined with the CPS sample data in order to describe the characteristics of the whole population. The CPS sample is designed so that the total number of people in the entire population represented by each person in the survey is known, and then each person can be “weighted” according to the information from the complete Census. For example, in *Numbers and Neighbors: A Detailed Description of Illinois' Uninsured* and *Numbers and Neighbors: Underlying Tables*, we report the weighted total and weighted percent of uninsured residents of Illinois under age 65 by select characteristics. These weighted data result from multiplying the sample estimates for those people in the CPS by the weights representing the appropriate population totals from the Census. This process permits us to arrive at estimates for all of Illinois.

## How accurate are the CPS data?

The March 2004 Supplement of the CPS weights the data using the 2000 Census, which means the numbers and percentages we present are likely to be accurate since the Census data are so recent. In addition to using timely data, another factor that influences accuracy is the size of the sample used in the CPS. One way that scientists have of measuring this component of accuracy is to calculate what is called a “confidence interval” around the reported numbers and percentages. The confidence interval provides a range of numbers or percents that indicates how close the sample data we report are to the actual number or percentage in the population. This is what public opinion polls mean when they say, for example, that 42% of people polled are supporting a candidate *plus or minus 4%*. The 42% is an estimate based on the small sample of voters who were included in the poll. The “plus or minus” defines a confidence interval that estimates the level of support for the candidate in the whole voting population as between 38%-46%.

The CPS provides instructions and general parameters needed for calculating statistically reasonable confidence intervals. This information can be found in the Source and Accuracy of Data Statement at <http://www.census.gov/apsd/techdoc/cps/cpsmar04.pdf> in Appendix G. The tables in ***Numbers and Neighbors: Underlying Tables*** present confidence intervals for the numbers and percentages in this report. Table 1.1 on p. 26, for example, shows that the percent of individuals under age 65 who are uninsured in Illinois in 2003 is 16.2%, with a 95% confidence interval of 15.0%-17.4%. This means that although 16.2% is an estimate, we are almost certain that the true percent of individuals who are uninsured in Illinois is between 15.0%-17.4%. The narrower the confidence interval, the more reliable the estimate. In general, data were included in ***Numbers and Neighbors: A Detailed Description of Illinois' Uninsured*** if numbers and percentages were based on at least 75,000 individuals or 25,000 households. Using this approach typically results in confidence intervals that are reasonably narrow. In some instances, however, the confidence intervals around numbers or percents might be fairly wide. We caution the reader to take these data for what they are—suggestive and worth further investigation but not as accurate as we would like.

## Methodology for the Report

The CPS asks multiple questions about insurance status. In order to capture the number and percent of people who are uninsured, these have to be combined into a single measure. The CPS recommends that individuals be considered uninsured if they answer “no” to all of the questions about the following sources of insurance coverage in the past year: group coverage, group coverage through a spouse, Medicaid, Medicare, Champus, children’s coverage by a person inside or outside of the household, or children’s coverage by Medicaid or Medicare.

Definitions for some other variables presented here should also be noted:

- Work status is only collected on individuals 16 years of age and older;
- “Unemployed” means a person did not work during 2003 but was looking for a job for at least one week during the year. “Non Worker/Out of Work Force” means a person did not work during 2003, and also did not actively look for work during the year.
- The selected industry data are only calculated for full-time and part-time workers;
- Educational attainment is only assessed for those 19 and older because any of the people in this age group should have had the opportunity to complete high school;
- The income variable is defined for families rather than for individuals;
- For race and ethnicity, the 2003 March Supplement for the first time allowed individuals to check more than one racial/ethnic category, or in other words, to identify themselves as multieth-

nic. If individuals identified themselves as Hispanic, this took precedence and they were classified as such. This means that the “whites,” “African-Americans,” and “Other and Multiethnic” groups include non-Hispanics only.

Four geographic areas were defined for this analysis: the State of Illinois, the City of Chicago, the metropolitan area outside of Chicago, and Downstate Illinois. The City of Chicago consists of all areas within the city border. The metropolitan area outside of Chicago is defined as suburban Cook County, DuPage County, Kane County, Kendall County, Will County, Grundy County, Lake County and McHenry County. Downstate Illinois is defined as all other areas of Illinois outside of Chicago and the remainder of the metropolitan area. For each geographic area, estimates of uninsurance are reported overall and also by select characteristics. In addition, we also present the number and percent of individuals who have private insurance or are insured through a publicly funded program.

The CPS data are reported for individuals and also for households which are defined as all individuals living together in one unit, regardless of whether they are related to one another. For this report, we consider these households as “families” and use this term throughout. We report data for individuals who are uninsured and for families in which at least one member is uninsured. The decision to focus on families in which at least one member is uninsured was made with the understanding that any uninsured individual has the potential for affecting the economic well being of the entire family as well as affecting his or her own health.

The elderly population—people 65 years old and older—were not included in this report since insurance coverage by Medicare is an entitlement for all U.S. citizens in this age group. Some low-income individuals, and particularly low-income children, are also entitled to health insurance coverage through Medicaid or the State Children’s Health Insurance Program (SCHIP, or KidCare in Illinois), but in contrast to Medicare, these programs have more complex eligibility requirements. We include data for the people for whom these programs are intended in this report because it is important to understand what proportion of the intended population is actually being covered.

The data in ***Numbers and Neighbors: A Detailed Description of Illinois' Uninsured*** and ***Numbers and Neighbors: Underlying Tables*** are presented from various perspectives. Both the numbers of uninsured and the percents, or rates, of uninsurance are presented. Numbers are critical for understanding how many people are affected by the lack of health insurance. Percents, or rates, of uninsurance are critical for understanding the relative impact of the problem across groups. Taken together, these data show the magnitude of the problem of the uninsured in Illinois.
